In March, both the maximum daily and monthly concentrations were below permit limits. Total Chlorine Residual in the effluent is a measure of the amount of chlorine that remains after the disinfection/dechlorination process. If the chlorine residual in the effluent is too high, it may threaten marine organisms.

In March, all permit conditions were met. Fecal Coliform is an indicator of the presence of pathogens. The levels of these bacteria after disinfection show how effectively the plant is inactivating many forms of disease-causing microorganisms. There are 4 conditions in the permit that must be met: daily geometric mean; a weekly geometric mean; 10% of all samples; and greater than three consecutive samples not to exceed 14,000 col/100mL.
